Legacy workflow migration

We migrate one workflow of up to ten steps between two agreed automation tools.

Who it helps

Operations and systems owners

The problem to solve

A workflow that works in one tool can behave differently in another if retries and connector limitations differ.

Working through the brief

1. **Inventory up to ten existing steps**

   Gather the agreed inputs. Current system map, test accounts, acceptance criteria and handover owners.

2. **Rebuild in the approved destination**

   Track “Original step” and “Destination equivalent” together so the reviewer can connect the source information to the result.

3. **Compare test results**

   Use the migration checks to confirm the replacement matches agreed results before switching over.

4. **Check the scope at handover**

   Platform, AI usage and connector subscriptions are separate.

Worked example

A legacy rule has no obvious equivalent. Document the exception and test the proposed handling before transfer.
