Replenishment planner

We build a reorder workbook for up to 50 items using supplied lead times and sales history.

Who it helps

Merchants and online retail teams

The problem to solve

Replenishment can lag demand if ordering relies on memory or ignores inconsistent supplier lead times.

Working through the brief

1. **Review sales and lead-time inputs**

   Gather the agreed inputs. Trading data, fulfilment rules or product launch brief pertinent to the assignment.

2. **Set reorder assumptions**

   Track “Item identifier” and “Supplier lead time” together so the reviewer can connect the source information to the result.

3. **Check example items**

   Use the planner to schedule stock reviews around what the sales and supplier records support.

4. **Check the scope at handover**

   Subscriptions, platform fees, advertising and fulfilment charges are separate.

Worked example

An item sells steadily but its supplier lead time has lengthened. Revisit the replenishment trigger against the revised lead time.
